(54) Title: METHODS OF TREATING DISEASES USING INHIBITORS OF NUCLEOSIDE PHOSPHORYLASES AND NU-
CLEOSIDASES

(57) Abstract: The invention relates to treating a disease or condition in which it is desirable to inhibit 5'-methylthioadenosine
phosphorylase (MTAP) and/or 5'-methylthioadenosine nucleosidase (MTAN). The invention particularly relates to the co-adminis-
tration of 5'-methylthioadenosine (MTA), or a prodrug of MTA, with one or more MTAP/MTAN inhibitors. Included among the
diseases treatable are prostate cancer and head and neck cancer.

WO 2007/097648 A1

**METHODS OF TREATING DISEASES USING INHIBITORS OF NUCLEOSIDE
PHOSPHORYLASES AND NUCLEOSIDASES**

TECHNICAL FIELD

5 The invention relates to treating a disease or condition in which it is desirable to inhibit 5'-methylthioadenosine phosphorylase (MTAP) and/or 5'-methylthioadenosine nucleosidase (MTAN). The invention is further concerned with treating a disease or condition in which it is desirable to inhibit MTAP/MTAN by administering to a patient 5'-methylthioadenosine (MTA), or a prodrug of MTA, and one or more MTAP/MTAN inhibitors. The invention also relates to
10 compositions containing MTA and one or more inhibitors of MTAP and/or MTAN. In particular, the invention relates to methods of treating prostate cancer or head and neck cancer by administering to a patient 5'-methylthioadenosine (MTA), or a prodrug of MTA, and one or more MTAP/MTAN inhibitors.

15 **BACKGROUND**

Certain nucleoside analogues have been identified as potent inhibitors of 5'-methylthioadenosine phosphorylase (MTAP) and 5'-methylthioadenosine nucleosidase (MTAN). These are the subject of US 7,098,334.

20 Compounds where the location of the nitrogen atom in the sugar ring is varied or where two nitrogen atoms form part of the sugar ring, have also been identified as inhibitors of MTAP and MTAN. These compounds are described in US 10/524,995.

MTAP and MTAN function in the polyamine biosynthesis pathway, in purine salvage in
25 mammals, and in the quorum sensing pathways in bacteria. MTAP catalyses the reversible phosphorolysis of methylthioadenosine (MTA) to adenine and 5-methylthio- α -D-ribose-1-phosphate (MTR-1P). MTAN catalyses the reversible hydrolysis of MTA to adenine and 5-methylthio- α -D-ribose and of S-adenosyl-L-homocysteine (SAH) to adenine and S-ribosyl-homocysteine (SRH). The adenine formed is subsequently recycled and converted into
30 nucleotides. Essentially, the only source of free adenine in the human cell is a result of the action of these enzymes. The MTR-1P is subsequently converted into methionine by successive enzymatic actions.

MTA is a by-product of the reaction involving the transfer of an aminopropyl group from
35 decarboxylated S-adenosylmethionine to putrescine during the formation of spermidine. The reaction is catalyzed by spermidine synthase. Likewise, spermine synthase catalyses the

conversion of spermidine to spermine, with concomitant production of MTA as a by-product. The spermidine synthase is very sensitive to product inhibition by accumulation of MTA. Therefore, inhibition of MTAP or MTAN severely limits the polyamine biosynthesis and the salvage pathway for adenine in the cells.

5

Although MTAP is abundantly expressed in normal cells and tissues, MTAP deficiency due to a genetic deletion has been reported with many malignancies. The loss of MTAP enzyme function in these cells is known to be due to homozygous deletions on chromosome 9 of the closely linked MTAP and *p16/MTS1* tumour suppressor gene. As absence of *p16/MTS1* is probably responsible for the tumour, the lack of MTAP activity is a consequence of the genetic deletion and is not causative for the cancer. However, the absence of MTAP alters the purine metabolism in these cells so that they are mainly dependent on the *de novo* pathway for their supply of purines.

10

MTA has been shown to induce apoptosis in dividing cancer cells, but to have the opposite, anti-apoptotic effect on dividing normal cells such as hepatocytes (E. Ansorena *et al.*, Hepatology, 2002, 35: 274-280).

15

MTAP inhibitors may therefore be used in the treatment of cancer. Such treatments are described in US 7,098,334 and US 10/524,995.

20

The need for new cancer therapies remains ongoing. For some prevalent cancers the treatment options are still limited. Prostate cancer, for example, is the most commonly diagnosed non-skin cancer in the United States. Current treatment options include radical prostatectomy, radiation therapy, hormonal therapy, and watchful waiting. Although the therapies may offer successful treatment of an individual's condition, the pitfalls are quite unfavorable and lead to a decrease in a man's overall quality of life. Surgery may inevitably result in impotence, sterility, and urinary incontinence. Side effects associated with radiation therapy include damage to the bladder and rectum as well as slow-onset impotence. Hormonal therapy will not cure the cancer and eventually most cancers develop a resistant to this type of therapy. The major risk associated with watchful waiting is that it may result in tumour growth, cancer progression and metastasis. It is therefore desirable that alternative treatment options are made available to patients diagnosed with prostate cancer.

25

30

MTAP and MTAN inhibitors may also be used in the treatment of diseases such as bacterial infections or protozoal parasitic infections, where it is desirable to inhibit MTAP/MTAN. Such

35

treatments are described in US 7,098,334 and US 10/524,995. However, the search continues for more effective treatments using these inhibitors.

It has now been found that the treatment of diseases in which it is desirable to inhibit MTAP/MTAN may be enhanced by administering exogenous MTA and/or a prodrug of MTA together with an MTAP/MTAN inhibitor. Thus, the combination of MTA and/or a prodrug of MTA and the MTAP/MTAN inhibitors employed according to the present invention provides a potentially effective treatment against diseases or disorders such as cancer and bacterial infections.

It is therefore an object of the invention to provide an improved method of treating a disease or condition in which it is desirable to inhibit MTAP or MTAN, or at least to provide a useful choice.

STATEMENTS OF INVENTION

In a first aspect, the invention provides a method of treating a disease or condition in which it is desirable to inhibit MTAP or MTAN comprising administering to a patient in need thereof MTA, or a prodrug of MTA, and one or more MTAP inhibitor(s) or one or more MTAN inhibitor(s).

Preferably the inhibitor of MTAP or MTAN is a compound of the formula (I):

wherein:

V is selected from CH₂ and NH, and W is selected from CHR¹, NR¹ and NR²; or V is selected from NR¹ and NR², and W is selected from CH₂ and NH;

X is selected from CH₂ and CHOH in the R or S-configuration;

Y is selected from hydrogen, halogen and hydroxy, except where V is selected from NH, NR¹ and NR² then Y is hydrogen;

Z is selected from hydrogen, halogen, hydroxy, SQ, OQ and Q, where Q is alkyl, aralkyl or aryl, each of which is optionally substituted with one or more substituents selected from hydroxy, halogen, methoxy, amino, or carboxy;

R¹ is a radical of the formula (II)

R² is a radical of the formula (III)

A is selected from N, CH and CR³, where R³ is alkyl, aralkyl or aryl, each of which is optionally substituted with one or more substituents selected from hydroxy and halogen; or R³ is hydroxyl, halogen, NH₂, NHR⁴, NR⁴R⁵; or SR⁶, where R⁴, R⁵ and R⁶ are alkyl, aralkyl or aryl groups, each of which is optionally substituted with one or more substituents selected from hydroxy and halogen;

B is selected from NH₂ and NHR⁷, where R⁷ is alkyl, aralkyl or aryl, each of which is optionally substituted with one or more substituents selected from hydroxy and halogen;

D is selected from hydroxy, NH₂, NHR⁸, hydrogen, halogen and SCH₃, where R⁸ is alkyl, aralkyl or aryl, each of which is optionally substituted with one or more substituents selected from hydroxy and halogen;

E is selected from N and CH;

G is selected from CH₂ and NH, or G is absent, provided that where W is NR¹ or NR² and G is NH then V is CH₂, and provided that where V is NR¹ or NR² and G is NH then W is CH₂; and provided that where W is CHR¹ then G is absent and V is NH;

or a tautomer thereof, or a pharmaceutically acceptable salt thereof, or a prodrug thereof.

Preferably the compound of formula (I) excludes (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(methylthiomethyl)pyrrolidine.

In preferred embodiments of the invention Z is SQ. In some embodiments Z is not methylthio.

Preferably Q is an alkyl group, optionally substituted with one or more substituents selected from hydroxy, halogen, methoxy, amino, and carboxy. It is further preferred that the alkyl group is a C₁-C₆ alkyl group, most preferably a methyl group.

It is also preferred that Q is an aryl group, optionally substituted with one or more substituents selected from hydroxy, halogen, methoxy, amino, and carboxy. More preferably the aryl group is a phenyl or benzyl group.

Preferably G is CH₂. It is also preferred that V is CH₂ and W is NR¹. It is further preferred that B is NH₂. It is also preferred that D is H, and it is preferred that A is CH.

Preferably any halogen is chlorine or fluorine.

In preferred embodiments of the invention the compound of formula (I) is a compound of the formula (IV):

where J is aryl, aralkyl or alkyl, each of which is optionally substituted with one or more substituents selected from hydroxy, halogen, methoxy, amino, and carboxy.

Preferably J is C₁-C₇ alkyl. More preferably J is methyl, ethyl, *n*-propyl, *i*-propyl, *n*-butyl, cyclobutyl, cyclopentyl, cyclohexyl, cyclohexylmethyl, or cycloheptyl.

It is also preferred that J is phenyl, optionally substituted with one or more halogen substituents. More preferably J is phenyl, *p*-chlorophenyl, *p*-fluorophenyl, or *m*-chlorophenyl.

It is also preferred that J is heteroaryl, 4-pyridyl, aralkyl, benzylthio, or -CH₂CH₂(NH₂)COOH.

In other preferred embodiments of the invention the compound of the formula (I) is a compound of the formula (V):

where T is aryl, aralkyl or alkyl, each of which is optionally substituted with one or more substituents selected from hydroxy, halogen, methoxy, amino, carboxy, and straight- or branched-chain C₁-C₆ alkyl.

Preferably T is C₁-C₆ alkyl, optionally substituted with one or more substituents selected from halogen and hydroxy. More preferably T is methyl, ethyl, 2-fluoroethyl, or 2-hydroxyethyl. Most preferably T is methyl.

It is also preferred that T is aryl, optionally substituted with one or more substituents selected from halogen and straight-chain C₁-C₆ alkyl. More preferably T is phenyl, naphthyl, *p*-tolyl, *m*-tolyl, *p*-chlorophenyl, *m*-chlorophenyl, or *p*-fluorophenyl.

It is also preferred that T is aralkyl. More preferably T is benzyl.

Preferably the inhibitor of MTAP or MTAN is:

(3R,4R)-1-[(8-aza-9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(hydroxymethyl)pyrrolidine;

(3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(2-phenylethyl)pyrrolidine;

(3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(benzylthiomethyl)pyrrolidine;

(3R,4S)-1-[(8-aza-9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(benzylthiomethyl)pyrrolidine;

(3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(4-chlorophenylthiomethyl)pyrrolidine;

(3R,4R)-1-[(9-deazaadenin-9-yl)methyl]-3-acetoxy-4-(acetoxymethyl)pyrrolidine;

(3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(*n*-butylthiomethyl)pyrrolidine;

(3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(4-fluorophenylthiomethyl)pyrrolidine;

(3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(*n*-propylthiomethyl)pyrrolidine;

- (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(cyclohexylthiomethyl)pyrrolidine;
- (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(3-chlorophenylthiomethyl)pyrrolidine;
- 5 (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(ethylthiomethyl)pyrrolidine;
- (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(phenylthiomethyl)pyrrolidine;
- (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(4-pyridylthiomethyl)pyrrolidine;
- (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-*n*-propylpyrrolidine;
- (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-
- 10 (homocysteinylmethyl)pyrrolidine;
- (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(benzyloxymethyl)pyrrolidine;
- (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(*i*-propylthiomethyl)pyrrolidine;
- (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(methoxymethyl)pyrrolidine;
- (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-
- 15 (cyclohexylmethylthiomethyl)pyrrolidine;
- (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(cycloheptylthiomethyl)pyrrolidine;
- (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(cyclopentylthiomethyl)pyrrolidine;
- 20 (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(cyclobutylthiomethyl)pyrrolidine;
- (1S)-1-(9-deazaadenin-9-yl)-1,4,5-trideoxy-1,4-imino-D-ribitol;
- (1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-1,4-imino-5-O-methyl-D-ribitol;
- (1S)-1-(7-amino-1H-pyrazolo[4,3-*d*]pyrimidin-3-yl)-1,4-dideoxy-1,4-imino-5-methylthio-D-ribitol;
- 25 (1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-5-ethylthio-1,4-imino-D-ribitol;
- (1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-1,4-imino-5-phenylthio-D-ribitol;
- (1S)-1-(9-deazaadenin-9-yl)-5-benzylthio-1,4-dideoxy-1,4-imino-D-ribitol;
- (1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-5-(2-hydroxyethyl)thio-1,4-imino-D-ribitol;
- (1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-1,4-imino-5-(4-methylphenyl)thio-D-ribitol;
- 30 (1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-1,4-imino-5-(3-methylphenyl)thio-D-ribitol;
- (1S)-1-(9-deazaadenin-9-yl)-5-(4-chlorophenyl)thio-1,4-dideoxy-1,4-imino-D-ribitol;
- (1S)-1-(9-deazaadenin-9-yl)-5-(3-chlorophenyl)thio-1,4-dideoxy-1,4-imino-D-ribitol;
- (1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-5-(4-fluorophenyl)thio-1,4-imino-D-ribitol;
- (1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-1,4-imino-5-(1-naphthyl)thio-D-ribitol;
- 35 (1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-5-(2-fluoroethyl)thio-1,4-imino-D-ribitol; or
- (1S)-1-(9-deazaadenin-9-yl)-1,4,5-trideoxy-5-ethyl-1,4-imino-D-ribitol.

The inhibitor of MTAP or MTAN may be administered simultaneously with the MTA or prodrug of MTA. Alternatively, the inhibitor of MTAP or MTAN may be administered prior to administration of the MTA or prodrug of MTA or after administration of the MTA or prodrug of MTA.

5

In another aspect, the invention provides a composition comprising synergistically effective amounts of i) one or more MTAP inhibitors or one or more MTAN inhibitors; and ii) MTA, or a prodrug of MTA.

- 10 Preferably the MTAP inhibitor or the MTAN inhibitor is a compound of the formula (I) as defined above.

Most preferably the MTAP inhibitor or the MTAN inhibitor is:

- 15 (3R,4R)-1-[(8-aza-9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(hydroxymethyl)pyrrolidine;
 (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(2-phenylethyl)pyrrolidine;
 (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(benzylthiomethyl)pyrrolidine;
 (3R,4S)-1-[(8-aza-9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(benzylthiomethyl)pyrrolidine;
 20 (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(4-chlorophenylthiomethyl)pyrrolidine;
 (3R,4R)-1-[(9-deazaadenin-9-yl)methyl]-3-acetoxy-4-(acetoxymethyl)pyrrolidine;
 (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(*n*-butylthiomethyl)pyrrolidine;
 (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(4-fluorophenylthiomethyl)pyrrolidine;
 25 (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(*n*-propylthiomethyl)pyrrolidine;
 (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(cyclohexylthiomethyl)pyrrolidine;
 (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(3-chlorophenylthiomethyl)pyrrolidine;
 30 (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(ethylthiomethyl)pyrrolidine;
 (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(phenylthiomethyl)pyrrolidine;
 (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(4-pyridylthiomethyl)pyrrolidine;
 (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(*n*-propyl)pyrrolidine;
 35 (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(homocysteinylmethyl)pyrrolidine;
 (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(benzyloxymethyl)pyrrolidine;

(3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(*i*-propylthiomethyl)pyrrolidine;
 (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(methoxymethyl)pyrrolidine;
 (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-
 (cyclohexylmethylthiomethyl)pyrrolidine;
 5 (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-
 (cycloheptylthiomethyl)pyrrolidine;
 (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-
 (cyclopentylthiomethyl)pyrrolidine;
 (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(cyclobutylthiomethyl)pyrrolidine;
 10 (1S)-1-(9-deazaadenin-9-yl)-1,4,5-trideoxy-1,4-imino-D-ribitol;
 (1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-1,4-imino-5-*O*-methyl-D-ribitol;
 (1S)-1-(7-amino-1H-pyrazolo[4,3-*d*]pyrimidin-3-yl)-1,4-dideoxy-1,4-imino-5-methylthio-
 D-ribitol;
 (1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-5-ethylthio-1,4-imino-D-ribitol;
 15 (1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-1,4-imino-5-phenylthio-D-ribitol;
 (1S)-1-(9-deazaadenin-9-yl)-5-benzylthio-1,4-dideoxy-1,4-imino-D-ribitol;
 (1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-5-(2-hydroxyethyl)thio-1,4-imino-D-ribitol;
 (1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-1,4-imino-5-(4-methylphenyl)thio-D-ribitol;
 (1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-1,4-imino-5-(3-methylphenyl)thio-D-ribitol;
 20 (1S)-1-(9-deazaadenin-9-yl)-5-(4-chlorophenyl)thio-1,4-dideoxy-1,4-imino-D-ribitol;
 (1S)-1-(9-deazaadenin-9-yl)-5-(3-chlorophenyl)thio-1,4-dideoxy-1,4-imino-D-ribitol;
 (1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-5-(4-fluorophenyl)thio-1,4-imino-D-ribitol;
 (1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-1,4-imino-5-(1-naphthyl)thio-D-ribitol;
 (1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-5-(2-fluoroethyl)thio-1,4-imino-D-ribitol; or
 25 (1S)-1-(9-deazaadenin-9-yl)-1,4,5-trideoxy-5-ethyl-1,4-imino-D-ribitol.

BRIEF DESCRIPTION OF THE FIGURES

Figure 1A shows the survival of mouse prostate cancer cells (RM1) against increasing concentrations of compound (2) either in the presence or absence of MTA.

Figure 1B shows the survival of human prostate cancer cells (PC3) against increasing concentrations of compound (2), either in the presence or absence of MTA.

Figure 2 is a time dependent proliferation curve, showing the effect of compound (2) and MTA on human prostate cancer cells (PC3).

Figure 3 is a time dependent proliferation curve, showing the effect of compound (2) and

MTA on SCC25 cells.

Figure 4 is a time dependent proliferation curve, showing the effect of compound (2) and MTA on FaDu cells.

5

Figure 5 shows phase contrast photographs of FaDu cells after 5 days of treatment with compound (2) and MTA.

Figure 6 shows a cell cycle and apoptosis analysis of FaDu cells after 6 days of treatment with compound (2) and MTA; (1) untreated results: G1 83.66%, S 8.08%, G2 8.26%, Apoptosis 6.06%; (2) treated with MTA results: G1 79.67%, S 10.42%, G2 9.91%, Apoptosis 6.66%; (3) treated with compound (3) results G1 72.06%, S 17.98%, G2 9.96%, Apoptosis 7.89%; (4) treated with MTA + compound (3) results G1 8.26%, S 31.25%, G2 60.49%, Apoptosis 29.41%.

15

Figures 7 to 19 show oral and IP availability of selected compounds that may be used in the methods of the invention including for compounds (1)-(3) and for ethylthio-DADMe-ImmA, para-chlorophenylthio-DADMe-ImmA, para-fluorophenylthio-DADMe-ImmA, phenylthio-DADMe-ImmA, and phenylthio-ImmA.

20

Figure 20 shows the effects of compound (2) on FaDu xenografts in NOD-SCID mice.

Figure 21 shows representative tumours from each of the treatment cohorts for the above NOD-SCID mouse study.

25

Figure 22 shows MRI images of TRAMP mice (Panels A and B: Control TRAMP (transgenic adenocarcinoma of mouse prostate) mice, Panels E and F: TRAMP mice treated with 1 mM compound (2).

30

Figure 23 shows that compound (2) and MTA alter polyamine levels and induce cytostasis in PC3 cells (PUT=putrescine, SPD=spermidine, SPN=spermine). PC3 cells were cultured and treated in triplicate as follows: untreated control, 20 μ M substrate (MTA) alone, 1 μ M compound (2) alone, or a combination of both substrate and inhibitor. Both cells and spent media were harvested at 1, 6, and 12 days for polyamine analysis by HPLC fluorescence.

35

Figures 24A, 24B and 24C show that compound (2) reduces tumour growth and metastasis in TRAMP mice, but does not alter polyamine levels *in vivo*. C56Bl/6 mice were treated with

100 μ M compound (2) via their drinking water and sacrificed at 24, 48 hours, and 7 days. Livers were immediately removed for polyamine analysis. TRAMP mice were treated approximately 6-8 months with 100 μ M compound (2) via their drinking water and control sacrificed. Livers were removed for polyamine analysis.

Figures 25A and 25B show Cal27 cells grown for 8 days as control (untreated), in the presence of 20 μ M MTA, 1 μ M compound (2) alone or in combination (1 μ M compound (2) + 20 μ M MTA).

- Figure 26 shows mouse lung cancer cells in culture responding to compound (1) in the presence of 20 μ M MTA and not responding in the absence of MTA.

DETAILED DESCRIPTION

Definitions

- The term "alkyl" is intended to include straight- and branched-chain alkyl groups, as well as cycloalkyl groups. The same terminology applies to the non-aromatic moiety of an aralkyl radical. Examples of alkyl groups include: methyl group, ethyl group, *n*-propyl group, *iso*-propyl group, *n*-butyl group, *iso*-butyl group, *sec*-butyl group, *t*-butyl group, *n*-pentyl group, 1,1-dimethylpropyl group, 1,2-dimethylpropyl group, 2,2-dimethylpropyl group, 1-ethylpropyl group, 2-ethylpropyl group, *n*-hexyl group and 1-methyl-2-ethylpropyl group.

- The term "aryl" means an aromatic radical having 6 to 18 carbon atoms and includes heteroaromatic radicals. Examples include monocyclic groups, as well as fused groups such as bicyclic groups and tricyclic groups. Some examples include phenyl group, indenyl group, 1-naphthyl group, 2-naphthyl group, azulenyl group, heptalenyl group, biphenyl group, indacenyl group, acenaphthyl group, fluorenyl group, phenalenyl group, phenanthrenyl group, anthracenyl group, cyclopentacyclooctenyl group, and benzocyclooctenyl group, pyridyl group, pyrrolyl group, pyridazinyl group, pyrimidinyl group, pyrazinyl group, triazolyl group, tetrazolyl group, benzotriazolyl group, pyrazolyl group, imidazolyl group, benzimidazolyl group, indolyl group, isoindolyl group, indoliziny group, purinyl group, indazolyl group, furyl group, pyranyl group, benzofuryl group, isobenzofuryl group, thienyl group, thiazolyl group, isothiazolyl group, benzothiazolyl group, oxazolyl group, and isoxazolyl group.

- The term "halogen" includes fluorine, chlorine, bromine and iodine.

The compounds are useful for the treatment of certain diseases and disorders in humans and other animals. Thus, the term "patient" as used herein includes both human and other animal patients.

5 The term "prodrug" as used herein means a pharmacologically acceptable derivative of the compound of formula (I), (IV) or (V), such that an *in vivo* biotransformation of the derivative gives the compound as defined in formula (I), (IV) or (V). Prodrugs of compounds of formulae (I), (IV) or (V) may be prepared by modifying functional groups present in the compounds in such a way that the modifications are cleaved *in vivo* to give the parent
10 compound.

Prodrugs include compounds of formulae (I), (IV) or (V), tautomers thereof and/or pharmaceutically acceptable salts thereof, which include an ester functionality, or an ether functionality. It will be clear to the skilled person that the compounds of formulae (I), (IV) or
15 (V) may be converted to corresponding ester or ether prodrugs using known chemical transformations. Suitable prodrugs include those where the hydroxyl groups of the compounds of formula (I), (IV) or (V) are esterified to give, for example, a primary hydroxyl group ester of propanoic or butyric acid. Other suitable prodrugs are alkylcarbonyloxymethyl ether derivatives on the hydroxyl groups of the compounds of formula (I), (IV) or (V) to give,
20 for example, a primary hydroxyl group ether with a pivaloyloxymethyl or a propanoyloxymethyl group.

The term "pharmaceutically acceptable salts" is intended to apply to non-toxic salts derived from inorganic or organic acids, including, for example, the following acid salts: acetate,
25 adipate, alginate, aspartate, benzoate, benzenesulfonate, bisulfate, butyrate, citrate, camphorate, camphorsulfonate, cyclopentanepropionate, digluconate, dodecylsulfate, ethanesulfonate, formate, fumarate, glucoheptanoate, glycerophosphate, glycolate, hemisulfate, heptanoate, hexanoate, hydrochloride, hydrobromide, hydroiodide, 2-hydroxyethanesulfonate, lactate, maleate, malonate, methanesulfonate, 2-naphthalenesulfonate, nicotinate, nitrate, oxalate, palmoate, pectinate, persulfate, 3-
30 phenylpropionate, phosphate, picrate, pivalate, propionate, *p*-toluenesulfonate, salicylate, succinate, sulfate, tartrate, thiocyanate, and undecanoate.

Discussion of Cancer Treatment

35 The present invention relates to methods of treating diseases in which it is desirable to inhibit MTAP/MTAN by administering to a patient in need thereof one or more inhibitors of MTAP/MTAN together with MTA, or a prodrug of MTA. In particular, the invention relates to

methods of treating certain cancers, such as prostate cancer or head and neck cancer by administering to a patient in need thereof one or more inhibitors of MTAP/MTAN together with MTA, or a prodrug of MTA.

- 5 Suitable MTAP/MTAN inhibitors which may be employed in the method of the present invention and the methods for preparing these inhibitors are described in US 7,098,334 and US 10/524,995.

10 Certain MTAP/MTAN inhibitor compounds are surprisingly effective for treating prostate and head and neck cancers. These are compounds of general formula (IV).

This sub-class of MTAP/MTAN inhibitors incorporates an adenine-like base moiety and a pyrrolidine moiety having an alkyl- aryl- or aralkylthiomethyl group at the 4-position.

- 15 Other MTAP/MTAN inhibitor compounds are also surprisingly effective for treating prostate and head and neck cancers. These are compounds of general formula (V).

This sub-class of MTAP/MTAN inhibitors also incorporates the adenine-like base moiety but has an iminoribitol moiety with an alkyl- aryl- or aralkylthiomethyl group at the 5'-position.

20

Examples of the first sub-class of inhibitors include compounds (1) and (2).

The Examples below show that compounds (1) and (2) are effective both *in vitro* and *in vivo* against a variety of cell lines (PC3, RM1, SCC25 and FaDu). These compounds are therefore particularly useful in the treatment of prostate and head and neck cancers.

5

The MTAP/MTAN inhibitor compounds inhibit cell growth *in vitro* of the prostate cancer cell lines PC3 and RM1 and the head and neck cancer cell lines SCC25 and FaDu. A surprising enhancement in the cell-killing effect is seen *in vitro* with combined administration of the MTAP/MTAN inhibitor compound plus MTA. Examples of this effect are shown in Figures 1 to 6.

10

Furthermore, the inhibitor compounds, when co-administered with MTA, exhibit a cytostatic effect on PC3 cells *in vitro*.

15

In order to determine whether the inhibition is selective for malignant cells, normal human fibroblast cells (GM02037) were also treated with compound (2) and MTA for 3 weeks. No cytotoxicity was observed. Compound (2) is therefore cytotoxic for human HNSCC (human head and neck squamous cell carcinoma) cells at doses that exhibit minimal toxicity for normal cells. This selectivity is a further indication that the MTAP/MTAN inhibitors described above are useful agents for the treatment of head and neck cancer.

20

The present *in vivo* studies further demonstrate the efficacy of the compounds. In a NOD-SCID mouse model, compound (2) significantly delays the growth of established FaDu xenografts. The *in vivo* effect is seen either with or without co-administration of the inhibitor compound with MTA.

25

In addition, prostate cancer progression in the TRAMP mouse model is inhibited in mice treated with compound (2), either alone or in combination with MTA.

30

An example of the second sub-class of inhibitors is compound (3).

This compound also inhibits prostate cancer progression in the TRAMP mouse model, when administered either alone or in combination with MTA.

- 5 For the above *in vivo* models, the inhibitor compounds exhibit activity when administered with exogenous MTA and when administered alone. There is not a significant enhancement observed when the inhibitors are administered together with MTA. However, the *in vitro* results clearly demonstrate a surprising enhancement in activity when the inhibitors are administered in conjunction with MTA. Thus, the combined administration method provides a
- 10 potential alternative treatment method for patients suffering from diseases where the administration of MTAP/MTAN inhibitors is indicated.

- It will be clear to the skilled person that the above-mentioned compounds, which are also inhibitors of MTAN, will be useful in treating diseases where it is desirable to inhibit MTAN.
- 15 Such diseases include bacterial infections and protozoal parasitic infections. Thus, the invention further relates to a method of treating such diseases, comprising administering to a patient one or more MTAN inhibitor compounds, together with MTA.

- The MTAP/MTAN inhibitor compounds of formulae (I), (IV) and (V) (in particular the compounds of formulae (IV) and (V)), when co-administered with MTA, provide an effective
- 20 alternative treatment option for sufferers of diseases such as cancer, bacterial infections or protozoal parasitic infections.

General Aspects

- 25 The MTAP/MTAN inhibitor compounds are useful in both free base form and in the form of salts.

- It will be appreciated that the representation of a compound of formula (I) where B and/or D is a hydroxy group, is of the enol-type tautomeric form of a corresponding amide, and this will
- 30 largely exist in the amide form. The use of the enol-type tautomeric representation is simply to allow fewer structural formulae to represent the compounds of the invention.

Similarly, it will be appreciated that the representation of a compound of formula (I), where B and/or D is a thiol group, is of the thioenol-type tautomeric form of a corresponding thioamide, and this will largely exist in the thioamide form. The use of the thioenol-type tautomeric representation is simply to allow fewer structural formulae to represent the compounds of the invention.

It will also be appreciated that the compounds depicted with bold solid lines are representations of the D-ribo or 2'-deoxy-D-erythro- stereochemical arrangement of substituents on the pyrrolidine ring, such as shown here.

Formulations and Modes of Administration

Figures 7, 9, 10, 12, 13, 15 and 16-19 show that the MTAP/MTAN inhibitor compounds used in the methods of the present invention are orally available, and may therefore be formulated for oral administration. The compounds may also be administered by other routes. For example, the MTAP/MTAN inhibitors may be administered to a patient orally, parenterally, by inhalation spray, topically, rectally, nasally, buccally or via an implanted reservoir. The amount of compound to be administered will vary widely according to the nature of the patient and the nature and extent of the disorder to be treated. Typically the dosage for an adult human will be in the range less than 1 to 1000 milligrams, preferably 0.1 to 100 milligrams. The specific dosage required for any particular patient will depend upon a variety of factors, including the patient's age, body weight, general health, sex, etc.

For oral administration the active compounds can be formulated into solid or liquid preparations, for example tablets, capsules, powders, solutions, suspensions and dispersions. Such preparations are well known in the art as are other oral dosage regimes not listed here. In the tablet form the compounds may be tableted with conventional tablet bases such as lactose, sucrose and corn starch, together with a binder, a disintegration agent and a lubricant. The binder may be, for example, corn starch or gelatin, the disintegrating agent may be potato starch or alginic acid, and the lubricant may be magnesium stearate. For oral administration in the form of capsules, diluents such as

lactose and dried cornstarch may be employed. Other components such as colourings, sweeteners or flavourings may be added.

When aqueous suspensions are required for oral use, the active ingredient may be combined with carriers such as water and ethanol, and emulsifying agents, suspending agents and/or surfactants may be used. Colourings, sweeteners or flavourings may also be added.

The compounds may also be administered by injection in a physiologically acceptable diluent such as water or saline. The diluent may comprise one or more other ingredients such as ethanol, propylene glycol, an oil, or a pharmaceutically acceptable surfactant.

The compounds may also be administered topically. Carriers for topical administration of the compounds include mineral oil, liquid petrolatum, white petrolatum, propylene glycol, polyoxyethylene, polyoxypropylene compound, emulsifying wax and water. The compounds may be present as ingredients in lotions or creams, for topical administration to skin or mucous membranes. Such creams may contain the active compounds suspended or dissolved in one or more pharmaceutically acceptable carriers. Suitable carriers include mineral oil, sorbitan monostearate, polysorbate 60, cetyl ester wax, cetearyl alcohol, 2-octyldodecanol, benzyl alcohol and water.

The compounds may further be administered by means of sustained release systems. For example, they may be incorporated into a slowly dissolving tablet or capsule.

Examples of suitable pharmaceutical carriers are described in Remington's Pharmaceutical Sciences (Mack Publishing Company).

EXAMPLES

Inhibitor Compounds Inhibitors of MTAP/MTAN were synthesized as described earlier (Singh, V., Shi, W., Evans, G. B., Tyler, P. C., Fumeaux, R H, Almo, S C, and Schramm, V L (2004) *Biochemistry* 43, 9-18; Evans G B, Furneaux R H, Lenz D H, *et al.*, *J Med Chem* 2005:48, 4679-89). Solutions were standardized by the UV absorbance of the 9-deazaadenine ring. Sterile solutions of inhibitors were prepared by filtration.

Protocol for Clonogenic Survival Assay of Cancer Cells

1. 60% confluent plates of experimental cell line was taken and subjected to trypsinization

2. Single cell suspension of the experimental cell line was made in the regular growth medium and number of cells per millilitre of suspension counted
3. A fixed low number of cells were plated out in a volume of 3ml of growth medium in each well of 6 well culture dishes and incubated overnight at 37°C in a CO₂ incubator
- 5 4. Measured volumes of the inhibitor and substrate solutions in sterile deionised cell culture water was added to each well of the 6 well plates. Typically each concentration of inhibitor and/or substrate was added in triplicate wells to calculate error bars. Final concentrations were calculated based on a total volume of 3ml of culture medium such that dilution factor did not exceed 1% of final volume.
- 10 5. Treated cell culture plates were incubated at 37°C in a CO₂ incubator for a period of 7 days
6. At the end of the period of incubation growth medium was removed from each well, attached cells were washed once with PBS and fixed by addition of 100% Formalin solution to each well and keeping at room temperature for ~1 hour.
- 15 7. At the end of 1 hour, formalin was removed from the wells and ~150µL of Crystal Violet staining solution was added to each well and let stand at room temperature for 30 min.
8. After staining is complete, wells were flushed with running tap water to remove traces of residual stain and dried by inverting over paper towels.
9. Number of crystal violet stained colonies in each well containing more than 60 cells
- 20 per colony was counted.
10. Assuming each colony originated from a single surviving cell post-treatment and taking the number of colonies in the untreated control well as 1, the fraction of surviving cells in each well was calculated and plotted in a graph.

25 ***Example 1: Clonogenic Assays (Figures 1A and 1B) for Compound (2)***

PC3 cells were grown in equal (1:1) portions of Dulbecco's modified Eagle's medium and F12 containing 10% fetal bovine serum, 10 U/mL penicillin-G and 10 µg/mL streptomycin in monolayers to near confluency at 37 °C. Cells were lysed in 50 mM sodium phosphate pH 7.5, 10 mM KCl and 0.5% Triton X-100.

30

Example 2: Effect of Compound 2 and MTA on PC3 cells (Figure 2)

PC3 cells were maintained in MEM Eagle's media supplemented with 10% fetal bovine serum, 100 units/ml penicillin, 100 µg/mL streptomycin, 0.1 mM non essential amino acids and 1 mM sodium pyruvate. Cell survival was evaluated using the WST-1 assay (Kicska G A, long Li, Horig H, et al. *Proc Natl Acad Sci USA* 2001;98:4593-98). Cells were seeded

35 onto 96 well plates at a density of 10⁴ cells per well, with either no additions, 1 µM compound (2), 20 µM MTA or 1 µM compound (2) + 20 µM MTA. IC₅₀ was determined following the

manufacturer's protocol (Roche Applied Science, IN). Cells were grown and measured in triplicate or quadruplicate and the error bars show the mean \pm SD of the multiple samples.

Example 3: Effect of Compound 2 and MTA on SCC25 cells (Figure 3)

5 SCC25 cells were maintained in MEM Eagle's media supplemented with 10% fetal bovine serum, 100 units/ml penicillin, 100 μ g/mL streptomycin, 0.1 mM non essential amino acids and 1 mM sodium pyruvate. Cell survival was evaluated using the WST-1 assay (Kicska G A, long Li, Horig H, *et al. Proc Natl Acad Sci USA* 2001;98:4593-98). Cells were seeded onto 96 well plates at a density of 10^4 cells per well, with either no additions, 1 μ M MT-
10 compound (2), 20 μ M MTA or 1 μ M compound (2) + 20 μ M MTA. IC_{50} was determined following the manufacturer's protocol (Roche Applied Science, IN). Cells were grown and measured in triplicate or quadruplicate and the error bars show the mean \pm SD of the multiple samples.

15 **Example 4: Effect of MT-DADMe-ImmA (Compound (2)) and MTA on FaDu cells (Figure 4)**

FaDu cells were maintained in MEM Eagle's media supplemented with 10% fetal bovine serum, 100 units/ml penicillin, 100 μ g/mL streptomycin, 0.1 mM non essential amino acids and 1 mM sodium pyruvate. Cell survival was evaluated using the WST-1 assay (Kicska G A, long Li, Horig H, *et al. Proc Natl Acad Sci USA* 2001;98:4593-98). Cells were seeded
20 onto 96 well plates at a density of 10^4 cells per well, with either no additions, 1 μ M compound (2), 20 μ M MTA or 1 μ M compound (2) + 20 μ M MTA. IC_{50} was determined following the manufacturer's protocol (Roche Applied Science, IN). Cells were grown and measured in triplicate or quadruplicate and the error bars show the mean \pm SD of the multiple samples.

25

Example 5: Phase Contrast Microscopy of FaDu Cells (Figure 5)

FaDu cells were subjected to six days in culture using the same conditions described as for Example 4.

30 **Example 6: Cell Cycle and Apoptosis Analysis of FaDu cells (Figure 6)**

FaDu cells were subjected to six days in culture using the same conditions described as for Example 4, before staining with propidium bromide and FACS cell sorting analysis.

Example 7: Oral Availability (Compound (2))

35 Two groups of 3 C57BL6 mice received a single oral dose of compound (2) dissolved in sterile, deionized water, pipetted onto a crumb of food. Treated food was fed to each mouse individually under close observation at time zero. Two different single doses of inhibitor were

administered: 50 µg and 100 µg. Mice were individually fed and closely observed for consumption of food. At specific time points, 4 µL blood samples were collected from the tail vein. The blood was mixed with 4 µL 0.6% Triton X-100 in PBS and stored at -80°C until time of analysis. The amount of adenine produced was measured by the following MTAP activity assay: Cells were harvested, washed three times with PBS and lysed with RIPA buffer. The reaction mixture for MTAP activity assays contained the following: ~ 75 µg protein from cell lysates, 50 mM HEPES pH 7.4, 50 µM MTA, and 20,000 dpm [2,8-3H]MTA. Labeled MTA was synthesized from [2,8-3H]S-adenosylmethionine by a known method. Products of the MTAP reaction were resolved using TLC silica plates with 1 M ammonium acetate, pH 7.55, and 5% isopropanol. Adenine spots were excised and counted for label incorporation.

Example 8: Oral and IP Availability for Selected Compounds (Figures 7 to 19)

Oral dosing was performed in essentially the same manner as for Example 7. For IP availability, 100 µg of the inhibitor was dissolved in around 200 µl of sterile deionised water and taken up in a 1ml syringe attached to a 26G needle and injected intraperitoneally in the mouse at 0min time point. Blood (4 µl) was collected from the tail of the mouse at specific time points, mixed with 4 µl of 0.6% TritonX-100 solution in PBS and stored at -80°C until ready for enzyme assay. Blood (4 µl) was collected from each mouse prior to injection which served as 0min control time point. Each experiment was repeated three times with three different mice to get standard error bars.

Example 9: FaDu Xenograft Studies (Figures 20 and 21)

NOD-SCID mice (6-8 weeks old) were obtained from Jackson Laboratory (Bar Harbor, Maine). FaDu cells (10^6) were inoculated into the dorsum of the hind foot. After 5 days, mice were treated with 9 mg/kg or 21 mg/kg body weight of compound (2) in drinking water or by daily i.p. injections of 5 mg/kg body weight of compound (2). After inoculation mice were assigned to treatment or control groups (n = 5). Tumor volume (V) was determined from: $V = (4/3) * (22/7) * 1/8 * (\text{length} * \text{width} * \text{height})$. Differences between treatment cohorts were determined using the Student's t test. Mice were weighed every 4-5 days, monitored for hair loss, loss of appetite, vomiting and diarrhoea. Total and differential blood and bone marrow analyses were performed after treatment with compound (2).

Example 10: MRI Studies (Figure 22)

MRI experiments were performed using a 9.4T 21 cm bore horizontal bore magnet (Magnex Scientific) Varian INOVA MRI system (Fremont, CA) equipped with a 28 mm inner diameter quadrature birdcage coil. Mice were anesthetized with isoflurane inhalation anesthesia (1-

1.5% in 100% O₂ administered via a nose cone) and positioned in the MRI coil. Body temperature was maintained (37-38°C) using a homeothermic warming system. After acquiring scout images, multi-slice spin-echo imaging with an echo time of 18 ms and a repetition time of 400ms ms was performed. A 40 mm field of view with a 256 x 256 matrix size was used. Nine to 15 slices along the transverse, sagittal, and coronal planes were acquired in each multi-slice experiment with a slice thickness of 1 mm and the gap between slices of 0.5 mm. MRI data were processed off-line with MATLAB-based MRI analysis software.

10 ***Example 11: Quantitation of Polyamines in Cells, Spent Media and Tissue Samples (Figure 23)***

Spent media and perchloric acid extracts of both PC3 cells and tissue samples were subjected to purification via cation exchange chromatography and dansyl-derivatized with minor changes. Disposable 10 ml BIO-RAD columns were centrifuged at 4,000 rpm for 3 minutes. Sodium carbonate used for derivatization was adjusted to pH 9.3 and the concentration of dansyl-chloride was adjusted to 100 mM. Dansyl-polyamines were quantitated by a Waters HPLC/ Fluorescence system. A Phenomenex Luna 5 μ C18 column was used with a mobile phase of 30% acetonitrile in a 50 mM ammonium acetate buffer at pH 6.8 (eluent A) and 100% acetonitrile (eluent B). Fluorescence detection was monitored by excitation at 338 nm and emission at 500 nm.

Example 12: Treatment of TRAMP Mice (Table 1, Figure 22)

Short-Term: Mice were treated with sterile solutions of 100 μ M compound (2) (pH ~6.4). Water bottles were autoclaved prior to filling with sterile inhibitor solutions. Mice were sacrificed at 1, 2, and 7 days, with three mice in each group, with the control group sacrificed after 7 days. Livers were immediately removed upon sacrifice for polyamine analysis, conducted as described above.

Long-Term: Sterile solutions of 100 μ M compound (2) (pH ~6.4). Water bottles were autoclaved prior to filling with sterile inhibitor solutions. Water consumption was monitored every other day, with fresh inhibitor solution being administered to prevent bacterial growth. Mice were control-sacrificed and tissues (genitourinary system, liver, lungs) were collected for histology and polyamine analysis. Mass and dimensions of excised genitourinary system tumours were recorded. Sections of small intestine were also removed for toxicity analysis via H&E staining.

Example 13: Mouse 3LL Cell Studies for Compound (1) (Figure 26)

Growth of 3LL and RM1 cells was in Dulbecco's modified Eagle's medium containing serum and antibiotics with 5 mM sodium pyruvate and 0.25 mM non essential amino acid mixture (Gibco). Compound (1) was added as a sterile solution and MTA was absent or present at 20 μ M.

Discussion of the Examples

Figure 1A shows the effect of the addition of compound (2) to cultured mouse prostate cancer cells (RM1). Figure 1B shows the effect of the addition of compound (2) to cultured human prostate cancer cells (PC3). Compound (2) was added either alone or in the presence of 20 μ M MTA. Figures 2, 3 and 4 show the effects of MTA alone, compound (2) alone, and MTA with compound (2) in time dependent cell proliferation experiments (PC3 cells, SCC25 cells and FaDu cells). The combination of compound (2) and MTA reduces cell proliferation. These data demonstrate that the compounds which are used in the methods of the present invention inhibit cell growth *in vitro*, when administered in combination with MTA.

Figure 5 further demonstrates, showing phase contrast photographs of FaDu cells after 5 days of treatment with compound (2)/compound (2) + MTA, that the inhibitor compound + MTA is effective in inhibiting cell growth:

Thus, administration of MTA in circumstances where its degradation by MTAP is inhibited by an MTAP inhibitor leads to greater circulatory and tissue levels of MTA and consequently an enhanced effect in the treatment of cancer.

Figure 6 shows that compound (2) in combination with MTA is also effective for stopping cell cycling (for FaDu cells) such that the cells become apoptotic.

Figures 7 to 19 show oral and IP availability of selected compounds, including compounds (1)-(3) and ethylthio-DADMe-ImmA, para-chlorophenylthio-DADMe-ImmA, para-fluorophenylthio-DADMe-ImmA, phenylthio-DADMe-ImmA, and phenylthio-ImmA.

Figures 20 and 21 show the results of *in vivo* studies. The time-dependent growth of FaDu tumors in immunodeficient mice was suppressed by oral or intraperitoneal treatment with compound (2) (Figure 20). Tumors were established in mice for 5 days prior to oral or intraperitoneal treatments with compound (2). Tumor growth in animals treated with compound (2) was dose responsive and was significantly slower than in controls ($p < 0.06$). Representative tumors from the treatment cohorts are shown at 28 days after therapy began

(Figure 21). No significant differences in animal weight or in total and differential blood counts were seen between treatment and control groups after this treatment. Thus, compound (2) administration suppresses FaDu growth *in vivo* with low cytotoxicity. Subsequent to the 28 day compound (2) therapy, treatment was removed for a subsequent period of 28 days. There was no regrowth of tumor in those mice receiving the two highest doses of compound (2).

Another head and neck cancer cell line, Cal27 was also found to be susceptible to compound (2) and MTA. After 8 days of treatment, the number of viable Cal27 cells decreased as a result of G₂/M arrest and apoptosis when compared to controls (Figures 25A and 25B).

Longitudinal MRI provides a noninvasive means of monitoring prostate tumour growth in mice (Gupta S, Hastak K, Ahmad N, Lewin J S, Mukhtar H *Proc Natl Acad Sci USA* 2001 Aug 28;98(18):10350-5; Eng M H, Charles L G, Ross B D, Chrisp C E, Pienta K J, Greenberg N M, Hsu C X, Sanda M G *Urology* 1999 Dec;54(6):1112-9; Song S K, Qu Z, Garabedian E M, Gordon J I, Milbrandt J, Ackerman J J *Cancer Res.* 2002 Mar 1;62(5):1555-8.).

MRI was used to evaluate prostate tumour growth and progression longitudinally in TRAMP mice (either untreated or treated with a compound that may be used according the methods of the invention). Mice were imaged approximately monthly from 12-33 weeks of age. Representative MRI images comparing untreated control TRAMP and treated TRAMP mice at approximately 30 weeks of age are shown in Figure 22.

Panels A and B show results from control mice. Panel A shows a coronal section through of a 30 week old TRAMP mouse with a large tumour (bright tissue) that weighed 8.76 g upon dissection at 34 weeks of age. The inset shows a more posterior coronal section. The bright tumour is smaller in this section but metastasis to the liver is observed (white arrow). Panel B shows a coronal section through the prostate region of a 30 week old TRAMP mouse. The seminal vesicles (SV) are enlarged. A large tumour (weighing 4.89 g upon dissection at 36 weeks of age) that spanned from the kidney to bladder (BL) is visible in the transverse section shown in the inset (white arrow).

Panels E and F show results for mice treated with 1 mM compound (2). Panel E shows a coronal section through the prostate region of a 30 week old treated TRAMP mouse. The tumour, weighing 0.41 g upon dissection at 34 weeks of age, was not observed during the imaging session. Panel F shows a similar section through a 30 week old treated TRAMP

mouse that exhibited a 0.64 g tumour upon dissection at 39 weeks of age. The tumour is indicated by the white arrow in the MRI image shown in this panel.

Untreated TRAMP mice therefore demonstrate primary prostate tumour growth. However,
5 prostate cancer progression in the TRAMP mouse is inhibited in mice treated with compound (2), either alone or in combination with MTA.

Figure 23 shows that compound (2) and MTA, administered together, alter polyamine levels and induce cytostasis in PC3 cells. Combination treatment of PC3 cells with compound (2)
10 and MTA for 1 day resulted in a significant 6-fold increase in intracellular PUT levels ($3.03 \times 10^{-3} \pm 2.86 \times 10^{-2}$, combination treated cells vs. $5.04 \times 10^{-2} \pm 1.08 \times 10^{-2}$, control, $p = 0.001$, pmoles PUT/mg protein), a 2-fold increase in spent media PUT levels [$1.19 \times 10^{-3} \pm 2.04 \times 10^{-1}$, combination treated media vs. $5.85 \times 10^{-2} \pm 5.09 \times 10^{-0}$, control media, $p = 0.0001$, pmoles PUT/mL spent media, as well as roughly a 2.5-fold increase in intracellular SPD
15 levels ($7.19 \times 10^{-3} \pm 4.38 \times 10^{-2}$, combination treated cells vs. $3.05 \times 10^{-3} \pm 6.3 \times 10^{-2}$, control, $p = 0.001$ pmoles SPD/mg protein). SPN levels in combination treated spent media also slightly decreased ($p = 0.02$). After 6 days of treatment, cellular SPN levels were decreased roughly 0.5-fold ($4.0 \times 10^{-3} \pm 7.38 \times 10^{-2}$, combination treated cells vs. $6.87 \times 10^{-3} \pm 9.68 \times 10^{-2}$, control, $p = 0.005$, pmoles SPN/mg protein), with both PUT and SPD elevated ($p = 0.02$ and
20 $p = 0.01$, respectively in comparison to controls). Most significantly, levels of PUT in spent media were almost double that of the control ($2.41 \times 10^{-3} \pm 7.35 \times 10^{-1}$, combination treated spent media vs. $1.31 \times 10^{-3} \pm 0.0$, control, $p = 0.0007$, pmoles PUT/mL spent media). By day 12, a significant increase in cellular SPD levels were observed ($9.05 \times 10^{-3} \pm 1.09 \times 10^{-3}$, combination treated cells vs. $3.93 \times 10^{-3} \pm 8.4 \times 10^{-1}$, control, $p = 0.007$, pmoles SPD/mg
25 protein), with a corresponding decrease in levels of spent media PUT levels ($1.65 \times 10^{-3} \pm 2.27 \times 10^{-2}$, combination treated spent media vs. $2.12 \times 10^{-3} \pm 9.34 \times 10^{-1}$, control media, pmoles PUT/mL spent media, $p = 0.013$). Intracellular PUT levels in combination treated cells were still significantly higher than controls ($p = 0.005$).

30 Treatment of PC3 cells with compound (2) resulted in numerous significant alterations in both intracellular and spent media polyamine levels. After 24 hours of treatment, the increase observed in cellular SPD levels as well as putrescine (PUT) cellular and spent media polyamine levels correlated with the effects expected with MTAP inhibition. MTA accumulated in the cells, began feedback inhibition of SPN synthase, resulting in
35 accumulations of SPD and PUT, with PUT being significantly excreted into the media, and a slight decrease of SPN in the media. By day 6, cellular SPN levels were significantly reduced in combination treated cells, while maintaining the characteristic elevations in levels

of PUT and SPD. Treatment of cells for 12 days showed a significant increase in cellular SPD levels and a slight decrease in spent media PUT levels, pointing to the fact that a compensatory pathway had been activated to make up for the block in MTAP. PUT may have been being taken up from the media for SPD synthesis. After combination treatment for approximately 2 weeks, PC3 cells displayed a cytostatic effect, as determined by the clonogenic assay. Initially, it was believed that MTAP inhibition would lead to MTA accumulation, causing feedback inhibition of polyamine biosynthesis, resulting in decreases in cellular proliferation. Although a halt in cellular proliferation was observed, this is clearly not due simply to polyamine depletion.

Figures 24A-C show that compound (2) reduces tumour growth and metastasis in TRAMP mice, but does not alter polyamine levels *in vivo*. Polyamine levels of mice livers were not significantly altered during short-term treatment (Figure 24A). After extended treatment with compound (2) inhibitor solutions, no significant alterations in either TRAMP liver or GUS polyamine levels were detected (Figures 24B and 24C).

Mass (Table 1) and dimensions of excised genitourinary system tumors were recorded for all members of the treatment groups. Sections of small intestine were also removed for toxicity analysis via H&E staining. Histology of TRAMP mice revealed all animals showed extensive prostate intraepithelial neoplasia involving most prostate acini. However, the size and incidence of preinvasive tumors, as well as the incidence of invasive cancer and metastasis were all decreased in treated TRAMP mice (Table 1). No alterations, inflammations, or irregularities were observed in the intestinal crypts, neither were any hair loss or general GI problems noted, indicating a lack of drug toxicity.

Table 1: Summary of results for TRAMP mice treated with compound (2)

Experimental Condition	# Animals (n)	Tumor Size (g)	Weeks treated	Metastatic Cancer
Control	16	4.0 ± 2.8	32 ± 5	44%
100 µM compound (2)	12	1.7 ± 0.8	29 ± 7	8%

Figure 26 shows mouse lung cancer cells in culture responding to compound (1) in the presence of 20 μ M MTA and not responding in the absence of MTA. This establishes that the effect of the inhibitor is on MTAP and that cancer cell lines are susceptible to this treatment.

5

Although the invention has been described by way of example, it should be appreciated the variations or modifications may be made without departing from the scope of the invention. Furthermore, when known equivalents exist to specific features, such equivalents are incorporated as if specifically referred to in the specification.

10

INDUSTRIAL APPLICABILITY

The co-administration of 5'-methylthioadenosine (MTA), or a prodrug of MTA, with one or more MTAP/MTAN inhibitors is effective for treating diseases or conditions in which it is desirable to inhibit MTAP or MTAN. Such diseases include prostate cancer and head and

15

neck cancer.

CLAIMS

1. A method of treating a disease or condition in which it is desirable to inhibit MTAP or MTAN comprising administering to a patient in need thereof MTA, or a prodrug of MTA, and one or more MTAP inhibitors or one or more MTAN inhibitors.

5

2. A method as claimed in claim 1 where the inhibitor of MTAP and/or MTAN is a compound of the formula (I):

10

wherein:

V is selected from CH₂ and NH, and W is selected from CHR¹, NR¹ and NR²; or V is selected from NR¹ and NR², and W is selected from CH₂ and NH;

X is selected from CH₂ and CHOH in the R or S-configuration;

Y is selected from hydrogen, halogen and hydroxy, except where V is selected from NH, NR¹ and NR² then Y is hydrogen;

15

Z is selected from hydrogen, halogen, hydroxy, SQ, OQ and Q, where Q is alkyl, aralkyl or aryl, each of which is optionally substituted with one or more substituents selected from hydroxy, halogen, methoxy, amino, or carboxy;

R¹ is a radical of the formula (II)

20

R² is a radical of the formula (III)

- 28 -

(III)

A is selected from N, CH and CR³, where R³ is alkyl, aralkyl or aryl, each of which is optionally substituted with one or more substituents selected from hydroxy and halogen; or R³ is hydroxyl, halogen, NH₂, NHR⁴, NR⁴R⁵; or SR⁶, where R⁴, R⁵ and R⁶ are alkyl, aralkyl or aryl groups, each of which is optionally substituted with one or more substituents selected from hydroxy and halogen;

B is selected from NH₂ and NHR⁷, where R⁷ is alkyl, aralkyl or aryl, each of which is optionally substituted with one or more substituents selected from hydroxy and halogen;

D is selected from hydroxy, NH₂, NHR⁸, hydrogen, halogen and SCH₃, where R⁸ is alkyl, aralkyl or aryl, each of which is optionally substituted with one or more substituents selected from hydroxy and halogen;

E is selected from N and CH;

G is selected from CH₂ and NH, or G is absent, provided that where W is NR¹ or NR² and G is NH then V is CH₂, and provided that where V is NR¹ or NR² and G is NH then W is CH₂; and provided that where W is CHR¹ then G is absent and V is NH;

or a tautomer thereof, or a pharmaceutically acceptable salt thereof, or a prodrug thereof.

3. A method as claimed in claim 2 where the compound of formula (I) excludes (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(methylthiomethyl)pyrrolidine.

4. A method as claimed in claim 2 or claim 3 where Z is SQ.

5. A method as claimed in claim 4 where Z is not methylthio.

6. A method as claimed in claim 4 where Q is an alkyl group, optionally substituted with one or more substituents selected from hydroxy, halogen, methoxy, amino, and carboxy.

7. A method as claimed in claim 6 where the alkyl group is a C₁-C₈ alkyl group.
8. A method as claimed in claim 7 where the C₁-C₈ alkyl group is a methyl group.
- 5 9. A method as claimed in claim 4 where Q is an aryl group, optionally substituted with one or more substituents selected from hydroxy, halogen, methoxy, amino, and carboxy.
- 10 10. A method as claimed in claim 9 where the aryl group is a phenyl or benzyl group.
11. A method as claimed in any one of claims 2 to 10 where G is CH₂.
12. A method as claimed in claim 11 where V is CH₂ and W is NR¹.
- 15 13. A method as claimed in any one of claims 2 to 12 where B is NH₂.
14. A method as claimed in any one of claims 2 to 15 where D is H.
15. A method as claimed in any one of claims 2 to 14 where A is CH.
- 20 16. A method as claimed in any one of claims 2 to 15 where any halogen is chlorine or fluorine.
- 25 17. A method as claimed in claim 2 where the compound of the formula (I) is a compound of the formula (IV):

where J is aryl, aralkyl or alkyl, each of which is optionally substituted with one or more substituents selected from hydroxy, halogen, methoxy, amino, and carboxy, or a pharmaceutically acceptable salt thereof, or a prodrug thereof.

30

18. A method as claimed in claim 17 where J is C₁-C₇ alkyl.

19. A method as claimed in claim 18 where J is methyl, ethyl, *n*-propyl, *i*-propyl, *n*-butyl, cyclobutyl, cyclopentyl, cyclohexyl, cyclohexylmethyl, or cycloheptyl.
- 5 20. A method as claimed in claim 17 where J is phenyl, optionally substituted with one or more halogen substituents.
21. A method as claimed in claim 20 where J is phenyl, *p*-chlorophenyl, *p*-fluorophenyl, or *m*-chlorophenyl.
- 10 22. A method as claimed in claim 17 where J is heteroaryl, 4-pyridyl, aralkyl, benzylthio, or $-\text{CH}_2\text{CH}_2(\text{NH}_2)\text{COOH}$.
23. A method as claimed in claim 2 where the compound of the formula (I) is a compound
15 of the formula (V):

- where T is aryl, aralkyl or alkyl, each of which is optionally substituted with one or more substituents selected from hydroxy, halogen, methoxy, amino, carboxy, and straight- or branched-chain $\text{C}_1\text{-C}_6$ alkyl;
- 20 or a pharmaceutically acceptable salt thereof, or a prodrug thereof.
24. A method as claimed in claim 23 where T is $\text{C}_1\text{-C}_6$ alkyl, optionally substituted with one or more substituents selected from halogen and hydroxy.
- 25 25. A method as claimed in claim 24 where T is methyl, ethyl, 2-fluoroethyl, or 2-hydroxyethyl.
26. A method as claimed in claim 23 where T is aryl, optionally substituted with one or more substituents selected from halogen and straight-chain $\text{C}_1\text{-C}_6$ alkyl.

27. A method as claimed in claim 23 where T is phenyl, naphthyl, *p*-tolyl, *m*-tolyl, *p*-chlorophenyl, *m*-chlorophenyl or *p*-fluorophenyl.
28. A method as claimed in claim 23 where T is aralkyl.
- 5 29. A method as claimed in claim 28 where T is benzyl.
30. A method as claimed in claim 1 where the inhibitor of MTAP or MTAN is:
- 10 (3R,4R)-1-[(8-aza-9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(hydroxymethyl)pyrrolidine;
- (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(2-phenylethyl)pyrrolidine;
- (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(benzylthiomethyl)pyrrolidine;
- (3R,4S)-1-[(8-aza-9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(benzylthiomethyl)pyrrolidine;
- 15 (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(4-chlorophenylthiomethyl)pyrrolidine;
- (3R,4R)-1-[(9-deazaadenin-9-yl)methyl]-3-acetoxy-4-(acetoxymethyl)pyrrolidine;
- (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(*n*-butylthiomethyl)pyrrolidine;
- (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(4-fluorophenylthiomethyl)pyrrolidine;
- 20 (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(*n*-propylthiomethyl)pyrrolidine;
- (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(cyclohexylthiomethyl)pyrrolidine;
- (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(3-chlorophenylthiomethyl)pyrrolidine;
- 25 (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(ethylthiomethyl)pyrrolidine;
- (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(phenylthiomethyl)pyrrolidine;
- (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(4-pyridylthiomethyl)pyrrolidine;
- (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-*n*-propylpyrrolidine;
- 30 (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(homocysteinylmethyl)pyrrolidine;
- (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(benzyloxymethyl)pyrrolidine;
- (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(*i*-propylthiomethyl)pyrrolidine;
- (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(methoxymethyl)pyrrolidine;
- 35 (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(cyclohexylmethylthiomethyl)pyrrolidine;
- (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-

(cycloheptylthiomethyl)pyrrolidine;
 (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-
 (cyclopentylthiomethyl)pyrrolidine;
 (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(cyclobutylthiomethyl)pyrrolidine;
 5 (1S)-1-(9-deazaadenin-9-yl)-1,4,5-trideoxy-1,4-imino-D-ribitol;
 (1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-1,4-imino-5-O-methyl-D-ribitol;
 (1S)-1-(7-amino-1H-pyrazolo[4,3-d]pyrimidin-3-yl)-1,4-dideoxy-1,4-imino-5-methylthio-
 D-ribitol;
 (1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-5-ethylthio-1,4-imino-D-ribitol;
 10 (1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-1,4-imino-5-phenylthio-D-ribitol;
 (1S)-1-(9-deazaadenin-9-yl)-5-benzylthio-1,4-dideoxy-1,4-imino-D-ribitol;
 (1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-5-(2-hydroxyethyl)thio-1,4-imino-D-ribitol;
 (1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-1,4-imino-5-(4-methylphenyl)thio-D-ribitol;
 (1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-1,4-imino-5-(3-methylphenyl)thio-D-ribitol;
 15 (1S)-1-(9-deazaadenin-9-yl)-5-(4-chlorophenyl)thio-1,4-dideoxy-1,4-imino-D-ribitol;
 (1S)-1-(9-deazaadenin-9-yl)-5-(3-chlorophenyl)thio-1,4-dideoxy-1,4-imino-D-ribitol;
 (1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-5-(4-fluorophenyl)thio-1,4-imino-D-ribitol;
 (1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-1,4-imino-5-(1-naphthyl)thio-D-ribitol;
 (1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-5-(2-fluoroethyl)thio-1,4-imino-D-ribitol; or
 20 (1S)-1-(9-deazaadenin-9-yl)-1,4,5-trideoxy-5-ethyl-1,4-imino-D-ribitol.

31. A method as claimed in claim 1 where the disease or condition is cancer or a bacterial infection.
- 25 32. A method as claimed in claim 31 where the cancer is prostate cancer or head and neck cancer.
33. A method as claimed in claim 1 where the inhibitor of MTAP or MTAN is administered simultaneously with the MTA or prodrug of MTA.
- 30 34. A method as claimed in claim 1 where inhibitor of MTAP or MTAN is administered prior to administration of the MTA or prodrug of MTA or after administration of the MTA or prodrug of MTA.
- 35 35. A composition comprising synergistically effective amounts of i) one or more MTAP inhibitors or one or more MTAN inhibitors; and ii) MTA, or a prodrug of MTA.

36. A composition as claimed in claim 35 where the MTAP inhibitor or the MTAN inhibitor is a compound of the formula (I) as defined in claim 2.

37. A composition as claimed in claim 36 where the MTAP inhibitor or the MTAN inhibitor is:

(3R,4R)-1-[(8-aza-9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(hydroxymethyl)pyrrolidine;

(3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(2-phenylethyl)pyrrolidine;

(3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(benzylthiomethyl)pyrrolidine;

(3R,4S)-1-[(8-aza-9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(benzylthiomethyl)pyrrolidine;

(3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(4-chlorophenylthiomethyl)pyrrolidine;

(3R,4R)-1-[(9-deazaadenin-9-yl)methyl]-3-acetoxy-4-(acetoxymethyl)pyrrolidine;

(3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(*n*-butylthiomethyl)pyrrolidine;

(3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(4-fluorophenylthiomethyl)pyrrolidine;

(3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(*n*-propylthiomethyl)pyrrolidine;

(3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(cyclohexylthiomethyl)pyrrolidine;

(3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(3-chlorophenylthiomethyl)pyrrolidine;

(3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(ethylthiomethyl)pyrrolidine;

(3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(phenylthiomethyl)pyrrolidine;

(3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(4-pyridylthiomethyl)pyrrolidine;

(3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(*n*-propyl)pyrrolidine;

(3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(homocysteinylmethyl)pyrrolidine;

(3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(benzyloxymethyl)pyrrolidine;

(3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(*i*-propylthiomethyl)pyrrolidine;

(3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(methoxymethyl)pyrrolidine;

(3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(cyclohexylmethylthiomethyl)pyrrolidine;

(3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-

(cycloheptylthiomethyl)pyrrolidine;

(3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-

(cyclopentylthiomethyl)pyrrolidine;

- (3R,4S)-1-[(9-deazaadenin-9-yl)methyl]-3-hydroxy-4-(cyclobutylthiomethyl)pyrrolidine;
(1S)-1-(9-deazaadenin-9-yl)-1,4,5-trideoxy-1,4-imino-D-ribitol;
(1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-1,4-imino-5-O-methyl-D-ribitol;
(1S)-1-(7-amino-1H-pyrazolo[4,3-d]pyrimidin-3-yl)-1,4-dideoxy-1,4-imino-5-methylthio-
5 D-ribitol;
(1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-5-ethylthio-1,4-imino-D-ribitol;
(1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-1,4-imino-5-phenylthio-D-ribitol;
(1S)-1-(9-deazaadenin-9-yl)-5-benzylthio-1,4-dideoxy-1,4-imino-D-ribitol;
(1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-5-(2-hydroxyethyl)thio-1,4-imino-D-ribitol;
10 (1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-1,4-imino-5-(4-methylphenyl)thio-D-ribitol;
(1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-1,4-imino-5-(3-methylphenyl)thio-D-ribitol;
(1S)-1-(9-deazaadenin-9-yl)-5-(4-chlorophenyl)thio-1,4-dideoxy-1,4-imino-D-ribitol;
(1S)-1-(9-deazaadenin-9-yl)-5-(3-chlorophenyl)thio-1,4-dideoxy-1,4-imino-D-ribitol;
(1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-5-(4-fluorophenyl)thio-1,4-imino-D-ribitol;
15 (1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-1,4-imino-5-(1-naphthyl)thio-D-ribitol;
(1S)-1-(9-deazaadenin-9-yl)-1,4-dideoxy-5-(2-fluoroethyl)thio-1,4-imino-D-ribitol; or
(1S)-1-(9-deazaadenin-9-yl)-1,4,5-trideoxy-5-ethyl-1,4-imino-D-ribitol.
